

No. : 005/ST-FMH/Pradita/II/2025
Lampiran : -
Hal : Penugasan menjadi Reviewer Jurnal

Yang bertanda tangan di bawah ini, Dekan Fakultas Manajemen dan Humaniora dengan ini menugaskan:

Nama : Dr. Wiwi Idawati, SE., M.Si., Ak., CA., Asean CPA
Program Studi : Akuntansi

Dalam rangka mendukung upaya pelaksanaan Tridharma Perguruan Tinggi dengan ini Pusat Penelitian dan Pengabdian Masyarakat STIE IBS memberikan tugas dengan uraian sebagai berikut :

Kegiatan : Cogent Economics & Finance (Taylor and Francis Group)
Tugas : Review Overdue Manuscript ID QAEF-2024-1245
Judul : Digital financial inclusion, digital threshold, and urban-rural income gap
Tanggal : 30 November 2024
Tempat : 2, 3 & 4 Park Square, Milton Park, Abingdon, Oxfordshire, OX14 4RN, United Kingdom.

Demikian surat tugas ini agar dapat dilaksanakan sebaik-baiknya dan penuh tanggungjawab

Tangerang, 30 November 2024

Dekan Fakultas Manajemen dan Humaniora

30-Nov-2024

Dear Dr Wiwi Idawati,

Recently, you kindly agreed to review "Digital financial inclusion, digital threshold, and urban-rural income gap".

This e-mail is a formal reminder that this review is due in -3, on 03-Dec-2024.

Please click on the following link to access the manuscript and complete your review:

https://mc.manuscriptcentral.com/qaef?URL_MASK=3e32b291ee54467fa1c88b24a12e65da

or login to our review system at <https://mc.manuscriptcentral.com/qaef>.

If you need to set or reset your password, please click the link below. Following this link will take you to a page from which your permanent password can be set.

https://mc.manuscriptcentral.com/qaef?URL_MASK=972e959984bc40fe93ede14661ae43ab

Please note that the single use link will expire on 03-Dec-2024 9:26:42 AM GMT / 03-Dec-2024 4:26:42 AM EST. If the single use link has expired, you can generate a single use password by entering your email address into the Password Help function on your site log in page: <https://mc.manuscriptcentral.com/qaef>

Due to password confidentiality, the Editorial Office does not have any access to user passwords.

Your case-sensitive User ID: wiwi.idawati@ibs.ac.id.

Please do not hesitate to contact me or the Editorial Office Unable to Display Letter Tag (##ADMIN_CENTRE_CONTACT##) if you need any help.

Both myself and the authors look forward to receiving your review soon.

Sincerely,

Dr David McMillan
Deputy Academic Editor
Cogent Economics & Finance (Open Research)

Abstract QAEF-2024-1245

This paper examines how digital financial inclusion affects the income gap between urban and rural residents, based on panel data from 30 Chinese provinces from 2011 to 2022. The study finds that digital financial inclusion significantly narrows the income gap between urban and rural areas. This reduction is mainly due to the extensive coverage and depth of usage of digital financial services. However, the overall process of digitalization has also led to increased income disparities. Mechanistic analysis shows that digital financial inclusion reduces the income gap by boosting employment, expanding non-farm job opportunities, and improving human capital in rural areas. Heterogeneity analysis identifies a "digital divide," with digital financial inclusion benefiting economically advanced Eastern regions more than the less developed Central and Western regions. To address this divide, the study introduces a digital threshold variable and finds that exceeding this threshold significantly enhances the effectiveness of digital financial inclusion in narrowing the urban-rural income gap. Therefore, it is crucial to boost investment in digital financial inclusion, ease financial regulations in less developed regions, promote innovation in financial products, and improve financial literacy among rural residents to fully realize the benefits of digital financial inclusion.

16
17 **Abstract:** This paper examines how digital financial inclusion affects the income gap
18 between urban and rural residents, based on panel data from 30 Chinese provinces from
19 2011 to 2022. The study finds that digital financial inclusion significantly narrows the
20 income gap between urban and rural areas. This reduction is mainly due to the extensive
21 coverage and depth of usage of digital financial services. However, the overall process
22 of digitalization has also led to income inequality. Mechanistic analysis
23 shows that digital financial inclusion reduces the income gap by boosting employment
24 expanding non-farm job opportunities, and improving human capital in rural areas.
25 Heterogeneity analysis identifies a "digital divide," with digital financial inclusion
26 benefiting economically advanced Eastern regions more than the less developed Central
27 and Western regions. To address this divide, the study introduces a digital threshold
28 variable and finds that exceeding this threshold significantly enhances the effectiveness
29 of digital financial inclusion in narrowing the urban-rural income gap. Therefore, it is
30 crucial to boost investment in digital financial inclusion, ease financial regulations in
31 less developed regions, promote innovation in financial products, and improve financial
32 literacy among rural residents to fully realize the benefits of digital financial inclusion.

1. Introduction

As the world's largest developing country and home to the most impoverished, China faces significant challenges in addressing poverty, particularly in rural areas, which severely hampers balanced economic and social development. Since the reform and opening-up period, the Chinese government has made significant efforts in poverty alleviation, yielding remarkable results. In 2020, China announced that it had lifted all rural poor out of poverty according to the current standards. Over the past forty years, China has lifted nearly 800 million people out of poverty, representing about 75% of the global poverty reduction during this period. China's experience in poverty alleviation provides valuable lessons for other countries in their poverty reduction efforts. While absolute poverty has been eradicated, relative poverty remains a concern.

In 2022, the per capita disposable income was 49289 yuan for urban residents and 20133 yuan for rural residents, resulting in an urban-rural income ratio of 2.45.

Although this ratio has narrowed from 3.50 in 2012, a significant gap persists, underscoring the ongoing issue of urban-rural income inequality. Continuous advancements in technology, including big data, cloud computing, and artificial intelligence, have led to the emergence of digital inclusive finance. Compared to traditional finance, digital inclusive finance effectively reduces financial exclusion, improves financial resource allocation efficiency, and enhances access to financial services, providing crucial funding support for rural development. At a new stage of development, how digital inclusive finance can narrow the urban-rural income gap, and how it can do so, remains a question that requires further investigation.

Digital inclusive finance, as a new form of financial service, is fundamentally a part of financial development. Thus, its impact on the income gap between urban and rural residents should be understood within the broader context of the relationship between financial development and income distribution. Current academic research explores this relationship from two main perspectives. The first focuses on the link between traditional financial development and income distribution. Some scholars argue that financial development reduces income inequality, with its positive impact growing as the economy develops (Xu and Wang, 2023). Conversely, others suggest

1
2
3
4
5 that financial development can worsen income inequality, as disadvantaged groups
6 often have limited access to financial services (Akpa et al., 2024). Another view
7 proposes that financial development follows an inverted U-shaped trajectory in its
8 impact on income inequality (Vo et al., 2023). Initially, the income gap widens as
9 disadvantaged groups face challenges related to family background and personal skills.
10 However, as financial development progresses, improvements in contracts, markets,
11 and intermediaries enhance inclusivity, which eventually reduces income inequality.

53
54
55
56
57
58
59
60

The second perspective examines the relationship between inclusive finance and income distribution. Inclusive finance, formally introduced at the 2005 International Microfinance Conference, is a financial system that effectively and comprehensively provides services to all social strata, particularly low-income and impoverished groups.

The relationship between inclusive finance and income distribution remains debated. Some researchers claim that inclusive finance enhances financial stability (Khan et al., 2022), which in turn reduces income inequality (Siddiqi and Labelle, 2018; Luo and Li, 2022; Chinoda and Mashamba 2021), with more significant effects observed in developing countries (Omar and Anaba, 2020). On the other hand, some scholars argue that institutional factors lead to a positive correlation between inclusive finance and income inequality (Wong et al., 2023). Additionally, others contend that the relationship between inclusive finance and income inequality is an inverted U-shape (Fitratinnisa and Khoirunurroff, 2021; Sun and Tu, 2023), with inequality initially widening but eventually narrowing over time (Huang and Zhang, 2023). The third perspective explores the relationship between digital inclusive finance and income distribution.

Digital inclusive finance, introduced at the 2016 G20 Summit in Hangzhou, refers to promoting inclusive finance through digital financial services. This includes using digital technology to provide formal financial services to groups that lack access to or are underserved by traditional financial systems. Given its relatively recent emergence, research on the impact of digital inclusive finance on income disparity is still limited. Some scholars suggest that digital inclusive finance can reduce the income gap between urban and rural residents (Tao et al., 2020), primarily by easing credit constraints, supporting entrepreneurship (Tao et al., 2023), and fostering agricultural

1
2
3
4
5 technological innovation (Zhang et al., 2024). Taking a micro-level perspective, others
6 find an inverted U-shape relationship between digital inclusive finance and household
7 income inequality (Hu et al., 2023), with the turning point occurring earlier in
8 economically advanced regions. Furthermore, some researchers argue that differences
9 in financial literacy, driven by varying education levels, create a digital divide. This
10 divide hampers the positive effects of digital inclusive finance on rural residents'
11 welfare, ultimately exacerbating the urban-rural income gap (Yao and Ma, 2022).

12
13
14
15
16 While existing literature provides a solid foundation for understanding the
17 relationship between digital financial inclusion and the urban-rural income gap, certain
18 gaps remain. First, many studies rely on overall indices for regression analysis, without
19 considering the heterogeneity across different dimensions of the income gap. Second, few
20 studies include rural human capital accumulation in their analytical frameworks,
21 missing the opportunity to closely examine its impact on the effectiveness of digital
22 financial inclusion. Third, research has yet to fully explore how the digital divide
23 influences the income distribution effects of digital financial inclusion.

24
25
26
27
28
29
30
31
32 This paper offers several novel contributions to the current body of knowledge.
33 First, it approaches the topic from a comprehensive and a detailed perspective,
34 providing new insights into existing studies. Second, it investigates how digital
35 financial inclusion can reduce income disparities between urban and rural areas,
36 focusing on employment effects and rural human capital. The analysis includes both
37 theoretical and empirical components. Finally, it introduces a novel threshold variable
38 to analyze how the digital divide influences the income convergence effects of digital
39 financial inclusion.

The rest of the study is organized as follows: Section 2 outlines the theoretical
framework and research hypotheses. Section 3 details the research design. Section 4
presents the results of the empirical analysis. Section 5 provides further discussion.
Section 6 concludes with a summary of the results and provides relevant policy
recommendations.

Digital financial inclusion can substantially reduce credit barriers and enhance access to financial services in rural areas (De Moraes et al., 2023). Traditional lending often requires rural residents to provide significant collateral, excluding many potential borrowers (Aiyar et al., 2015). By utilizing digital technologies such as big data, financial institutions can consolidate users' credit information, thereby reducing information asymmetries between lenders and borrowers (Cheng et al., 2024). This approach not only lowers credit barriers for rural populations but also facilitates the flow of capital into these areas, expanding the reach of financial services (González-Romero and Ahamed, 2021). Moreover, digital financial inclusion transcends traditional financial services' time and location constraints, thereby reducing transaction costs for rural residents. With mobile devices, users can access financial services online, streamline credit approval processes, minimize the need for physical branch visits, and lower the overall cost of financial services. Finally, digital financial inclusion drives financial innovation and increases the adoption of financial products among rural residents (Gong et al., 2023). Technologies such as the internet, cloud computing, and blockchain are advancing tools for investment, credit, and insurance, broadening the spectrum of available financial products. These innovations, tailored to the unique needs of rural areas, offer low-threshold, low-risk, and cost-effective financial solutions, thereby boosting the use of these products among rural populations.

Digital financial inclusion reduces income inequalities between urban and rural areas by increasing employment and expanding non-agricultural job opportunities. It eases financial constraints for businesses, promotes technological innovation, and facilitates production scaling (Gong and Guo, 2023), thereby generating additional employment opportunities. Small and micro enterprises, essential for job creation, frequently face significant financing challenges due to insufficient collateral and difficulties in credit assessment (Zhang et al., 2023), which hinder their long-term growth. Digital financial inclusion expands financing options for these enterprises and

36

disadvantaged groups by providing access to formal financial services. This alleviates financial difficulties, fosters development and innovation (Li and Pang, 2023), enhances production efficiency (Abbasi et al., 2021), and creates more job opportunities. Additionally, digital financial inclusion promotes rural entrepreneurship (Tao et al., 2022; Yang et al., 2022) and supports the transformation of rural industries. China's dual economic structure has led to a significant imbalance in financial resources between urban and rural areas, resulting in inadequate funding for rural development. Digital financial inclusion addresses this imbalance by providing affordable, inclusive financial services, and ensuring sufficient resources for rural development. It fosters rural entrepreneurship, supports industry specialization, and generates non-agricultural jobs locally (Ren et al., 2023). Finally, digital financial inclusion facilitates smoother labor mobility between urban and rural areas, thereby improving non-agricultural employment. Rural workers migrating to cities often face frictional unemployment during job searches, which incurs costs for communication, transportation, and accommodation. Digital financial inclusion can provide short-term, interest-free working capital to help rural workers overcome initial financial barriers, increasing their likelihood of securing employment in urban areas. Considering these observations, Hypothesis 2 is proposed.

37

Digital financial inclusion reduces the income gap between urban and rural residents by enhancing the development of human capital in rural areas. It promotes increased investment in education among rural residents. Improving access to financial services such as savings, credit, and investments, expands income opportunities and facilitates greater investment in children's education. For instance, loans can be used by rural residents to support higher education and vocational training, thereby enhancing their skills and knowledge. Moreover, digital financial inclusion results in increased healthcare spending in rural areas. Since health is a crucial component of human capital, expanded financial inclusion raises health awareness and encourages greater investment in healthcare. Digital financial services offer rural residents access to health

1
2
3
4 insurance, medical advice, and healthcare services, improving overall health and
5 strengthening human capital within these communities. Based on these findings,
6
7 Hypothesis 3 is proposed.
8
9

10 H3: Digital financial inclusion reduces the income gap between urban and rural
11 residents by improving human capital in rural areas.

12 3. Research design

13 3.1 Sample Selection

14
15
16 Given the availability of digital data, this study utilizes annual data from 30
17 provinces in China (excluding Tibet) for the period from 2011 to 2022. The data is
18 sourced from the National Bureau of Statistics, provincial statistical bureaus, the China
19 Statistical Yearbook, and the Digital Finance Research Center of Tsinghua University.
20
21

22 3.2 Variable Definition

23 3.2.1 Dependent variable

24
25
26 The dependent variable in this study is income inequality, primarily focused on
27 disparity between urban and rural residents. Existing literature employs three indicators
28 to measure urban-rural income inequality: the ratio of urban to rural per capita
29 disposable income, the Gini coefficient, and the Theil index. The ratio of disposable
30 income per capita, as a static measure, overlooks the population distribution in urban
31 and rural areas, failing to account for population mobility and income dynamics. The
32 Gini coefficient measures overall income distribution inequality but is more sensitive to
33 changes in middle-class incomes, making it less effective in capturing urban-rural
34 income disparities. The Theil index, however, is more responsive to changes in high
35 and low-income groups, aligning better with the research objectives of this paper.
36
37 Therefore, the Theil index is selected as the core indicator for measuring income
38 inequality. Referring to (Casilla and Casilla, 2013), the calculation formula is as
39 follows:
40
41
42
43
44
45
46
47
48

$$49 \quad T_{ij,t} = \frac{1}{n} \sum_{i=1}^n \left[\frac{P_{i,t}}{P_{i,t}} \right] n \left[\frac{P_{ij,t}}{P_{i,t}} - \frac{Z_{ij,t}}{Z_{i,t}} \right] \quad (1)$$

50
51
52 Where j denotes urban and rural areas respectively, $Z_{i,t}$ represents the total
53 population of region i in year t , $Z_{ij,t}$ indicates the urban or rural population, $P_{i,t}$
54
55
56
57
58
59
60

1
2
3
4 represents the total disposable income of the region, $P_{ij,t}$ presents the total disposable
5

6 income of the urban or rural residents. The region's total income is calculated by
7 multiplying the population of the region by the per capita disposable income.
8
9

10 3.2.2 Independent variable

11 The Digital Financial Inclusion Index (Dfi) released by the Digital Finance
12 Research Center of Peking University is chosen as the explanatory variable of this paper
13 (Guo et al.,2020), which mainly includes three dimensions, breadth of coverage, depth
14 of use, and degree of digitization. The breadth of digital financial inclusion measures
15 the coverage of digital financial services, the more people have access to digital
16 financial inclusion, the higher the breadth of coverage; the depth of digital financial
17 inclusion measures the degree of use of digital financial services by residents, the higher
18 the amount of use, the greater the intensity of use, the deeper the depth of development;
19 the degree of digitization measures the degree of convenience brought by digital
20 financial inclusion, the lower the cost and the more convenient the digitalization, the
21 higher the degree of convenience brought by digital financial inclusion.
22
23
24
25
26
27
28
29
30

31 3.2.3 Mechanism variable

32 This paper investigates the impact mechanisms through two key areas:
33 employment effects and rural human capital development. Employment effects are
34 evaluated by full employment and non-farm employment. Overall employment is
35 determined by the number of urban jobs at year-end in each region. In contrast, non-
36 farm employment is measured by the ratio of jobs in the secondary and tertiary sectors
37 to total employment. Rural human capital development is assessed by combining per
38 capita expenditures on healthcare and education among rural residents.
39
40
41
42
43
44
45

46 3.2.4 Control variable

47 This study considers five control variables relevant to the income disparity
48 between urban and rural residents: regional per capita GDP (Pgdp), urbanization level
49 (Urban), fiscal expenditure (Fisc), regional education level (Edu), and the extent of
50 openness to international trade (Open). Specific definitions of these variables can be found
51
52
53
54
55 in Table A. 1.

56 3.3 Model Construction

57
58
59
60

$$Theil_{i,t} = \alpha_0 + \alpha_1 Dfi_{i,t} + \alpha_2 Control_{i,t} + \beta_i + \gamma_t + \varepsilon_{i,t} \quad (2)$$

where i is the province, t is the year, and $Theil_{i,t}$ represents the urban-rural income gap, $Dfi_{i,t}$ is the digital financial inclusion index, and $Control_{i,t}$ represents the control variables, and β_i represents province fixed effects, and γ_t represents year fixed effects, $\varepsilon_{i,t}$ represents the random interference term.

4.1 Descriptive statistics

In the empirical analysis, to ensure the stability of the model, logarithmic transformations were applied to the Digital Financial Inclusion Index (Dfi), coverage breadth (Coverage), usage depth (Depth), digitization level (Digitization), regional per capita GDP (Pgdp), regional total employment (Employment), rural human capital expenditure (Humanexp), and the instrumental variable (Distancedfi). After a rigorous selection process, we obtained 360 valid research samples and identified 15 key variables. The descriptive statistics for the main variables are presented in Table 1.

Table 1 Descriptive statistics

VARIABLES	(1) N	(2) Mean	(3) Sd	(4) Min	(5) Max

4.2 Benchmark regression

Table 2 presents the benchmark regression results. Column (1) displays the results of the Digital Financial Inclusion Index. After accounting for individual and time effects, it is found that a one-unit increase in digital financial inclusion significantly narrows the

income gap between urban and rural residents, with results statistically significant at the 1% level. Specifically, a 1% increase in digital financial inclusion is associated with a 0.00007-unit reduction in the income gap, validating Hypothesis 1. Columns (2) through (4) show the regression results for coverage breadth, usage depth, and digitization level. Coverage breadth and usage depth are both significantly effective in reducing the income gap between urban and rural residents. Conversely, a high level of digitization seems to exacerbate the income gap. This may be due to the increased complexity of financial services with more digitization. Rural residents, who generally have lower financial literacy, tend to use digital financial services less frequently than their urban counterparts, leading to a counterintuitive widening of the income gap.

4.3 Endogeneity test

In addition to the control variables selected for this study, there are numerous other variables affecting the income gap between urban and rural residents that are not included in the analysis framework, leading to the issue of omitted variables. Digital financial inclusion can influence the income gap, while an expanding income gap may also exacerbate the digital divide, affecting the development of digital financial inclusion. This suggests a potential bidirectional causality, which could introduce endogeneity issues and weaken the robustness of the study's conclusions.

To address the endogeneity issue, this study employs the instrumental variable (IV) approach. The spherical distance from each provincial capital city to Hangzhou is chosen as the instrument. Alibaba, a leading company in China's digital financial inclusion sector, is based in Hangzhou, and the digital financial inclusion index used in this study is derived from Alibaba data. Research indicates that the extent of digital financial inclusion is related to the distance from Hangzhou, thus the distance from Hangzhou affects the development of digital financial inclusion, satisfying the relevance condition for the instrument. Additionally, the distance from each provincial capital to Hangzhou does not change with economic or social conditions. By multiplying the spherical distance data with the annual provincial level digital financial inclusion index, we generate the overall national level of digital financial inclusion influencing provincial development. Thus, the product of these two variables is used as the instrumental variable for digital financial inclusion.

Table 3 displays the results of the instrumental variable regressions. Column (1) shows the results for the Digital Financial Inclusion Index, where the LM statistic is 29.901, rejecting the identification hypothesis, and the Cragg-Donald Wald F statistic is 31.186, indicating the instrument is effective according to the weak instrument test. The coefficient of the impact of digital financial inclusion on the income gap between urban and rural residents is -0.022, statistically significant at the 5% level. Columns (2) through (4) present the instrumental variable regression results for coverage breadth,

usage depth, and digitization level. The sign of the coefficients remains consistent with the baseline regression results, suggesting the robustness of the study's conclusions.

Compared to the baseline regression, the coefficients in the instrumental variable regressions are higher, indicating that endogeneity issues led to an underestimation of the impact of digital financial inclusion on the income gap. This implies that bidirectional causality and measurement errors are major contributors to endogeneity.

4.4 Mechanism test

Table 4 presents the regression results of the mechanism tests. This study explores the impact of digital inclusive finance through two key dimensions: employment effects and rural human capital accumulation. The analysis of employment effects, which includes both total employment and non-agricultural employment, is provided in columns (1) and (2). The impact of digital inclusive finance on the urban-rural income gap consistently indicates a reduction in disparity. However, the positive regression coefficients for the interaction between total employment, non-agricultural employment, and digital inclusive finance suggest a more significant effect in regions with lower employment levels and a smaller share of non-agricultural jobs. This implies that digital inclusive finance more effectively reduces the income gap in areas with lower overall employment and fewer non-agricultural jobs, thereby enhancing its role in promoting employment and increasing non-agricultural opportunities. Column (3) presents the findings related to rural human capital accumulation. Similarly, the influence of digital inclusive finance is stronger in regions with lower levels of rural human capital. Consequently, the pathways through which digital inclusive finance enhances employment, increases non-agricultural job opportunities, and promotes human capital accumulation are valid, confirming Hypotheses 2 and 3.

4.5 Regional heterogeneity

Table 5 shows the results of the regional heterogeneity analysis, which divides the 30 provinces into three geographical regions: Eastern, Central, and Western. In the Eastern region, digital inclusive finance significantly narrows the income gap between urban and rural residents. Conversely, in the Central region, digital inclusive finance has exacerbated the income gap. This may result from the rapid penetration of digital finance combined with notable disparities in education and financial literacy between urban and rural areas. The greater benefits for more advantaged groups, coupled with limited impact on disadvantaged rural residents, have contributed to increased polarization and income inequality. In the Western region, although the impact of digital inclusive finance on the urban-rural income gap is not statistically significant, it remains negative. The comparison reveals that the impact of digital inclusive finance on the urban-rural income gap varies significantly across regions, illustrating a digital divide. The effect is most pronounced in the more developed Eastern region.

4.6 Robustness testing

This study utilizes data trimming, the Generalized Method of Moments (GMM), and Limited Information Maximum Likelihood (LIML) methods for robustness check. Table 6 displays the results of these robustness checks in Columns (1) through (3) showing the regression outcomes from data trimming, GMM, and LIML, respectively. The results confirm that digital inclusive finance consistently reduces the income gap between urban and rural residents, thus reinforcing the robustness of the study's conclusions.

4.7 Extended analysis: the digital threshold effect

The regional heterogeneity analysis shows that digital inclusive finance more effectively narrows the income gap between urban and rural residents in the Eastern region, highlighting a digital divide between developed and less developed areas. The digital divide may establish a threshold that limits the effectiveness of digital inclusive finance in addressing the misallocation of financial resources between urban and rural areas, thus diminishing its impact on reducing the income gap. Consequently, a panel threshold model is developed to examine the effect of the digital threshold on the impact of digital inclusive finance on the urban-rural income gap.

The panel threshold model is as follows:

$$Theil_{i,t} = \alpha_0 + \alpha_1 Df_{i,t} I(q_{i,t} < h) + \alpha_2 Df_{i,t} I(q_{i,t} \geq h) + \beta_i + \gamma_t + \varepsilon_{i,t} \quad (3)$$

Where $I(\cdot)$ denotes the indicator function, h represents the threshold, and the definitions of the other variables are consistent with those used in the benchmark regression.

Table 7 shows the results of the panel threshold test, where the mobile phone ownership rate is used as the threshold variable to evaluate its impact on the convergence effect of digital inclusive finance. The analysis also includes regressions of secondary education indices for digital inclusive finance. The findings indicate that

the mobile phone ownership rate influences the convergence effect of digital inclusive finance on the urban-rural income gap, with a significant threshold identified at a rate of 1.0484. The mobile phone ownership rate also shows a single threshold effect for various dimensions of digital inclusive finance. Specifically, the threshold values are 1.0484 for coverage and digitalization extent, and 1.0425 for usage depth.

Table 7 Digital threshold test

Variables	Threshold type	F-statistic	P-value	Threshold value	Lower	Upper
Dfi	Single Threshold	29.36*	0.077	1.0484	1.0425	1.0489
Coverage	Single Threshold	29.97*	0.073	1.0484	1.0425	1.0489
Depth	Single Threshold	27.08*	0.090	1.0425	1.0391	1.0427
Digitization	Single Threshold	23.80*	0.080	1.0484	1.0415	1.0489

Note: ***, **, and * denote that the threshold is statistically significant at the 1%, 5%, and 10% levels.

Table 8 shows how digital inclusive finance affects the urban-rural income gap before and after surpassing the threshold. Before crossing the threshold, the coefficient indicating its effect on the income gap was -0.009. After exceeding the threshold, the coefficient was -0.010. Both coefficients are statistically significant at the 1% level. This finding suggests that digital inclusive finance's ability to reduce the income gap improves after surpassing the threshold. Specifically, the dimensions of coverage breadth and usage depth have a greater impact on narrowing the income gap after crossing the threshold. While the effect of digitalization level on the income gap continues to be negative, its widening effect has diminished. This suggests that digital inclusive finance, when delivered through mobile phones, becomes more effective in bridging the digital divide as mobile phone ownership rises. This facilitates the penetration of digital technology to remote rural areas, thereby supporting the growth of digital inclusive finance and improving its effectiveness in reducing the income gap.

4.3.2 Further discussion

Financial resources are central to driving economic growth and shaping income distribution in modern societies. Traditional financial systems, which typically demand collateral and credit history, disadvantage rural residents in accessing credit, thereby worsening income inequality between urban and rural areas in China (Xu et al., 2022). The advancement of technology has provided traditional finance with new development opportunities, giving rise to digital inclusive finance. This emerging form of finance has increased access to financial services (Yang et al., 2023), reduced

1
2
3
4
5 financial exclusion, and promoted inclusive growth (Shen et al., 2019; Demir et al.,
6 2020). The rise of digital inclusive finance mitigates rural financial repression, raises
7 rural income levels, and consequently narrows the income gap (Ozili, 2018; Shang,
8 2023; Liu and Guo, 2023). Digital inclusive finance reduces income inequality by
9 encouraging household entrepreneurship (Hao and Zhang, 2024; Song et al., 2024),
10 fostering industry integration (Wang et al., 2024; Yang et al., 2024), enhancing financial
11 service efficiency (Adugna, 2024), and creating more employment opportunities for
12 rural residents (Fu et al., 2024). Although previous studies have examined the
13 relationship between digital inclusive finance and the urban-rural income gap, further
14 in-depth analysis is required. This paper provides a comprehensive analysis of the
15 aggregate effects of digital inclusive finance from both general and structural
16 perspectives. It reveals that not all factors contribute to narrowing the urban-rural
17 income gap. While broader coverage and deeper usage help reduce the gap, a higher
18 degree of digitization can widen it. This occurs because increased digitization of
19 complicates financial services for rural residents, with generally lower financial
20 literacy, use these services less frequently than urban residents. Since digital
21 measures the cost of using digital inclusive finance, higher usage frequency results in
22 lower costs. By integrating digital inclusive finance with employment effects, human
23 capital accumulation, and the urban-rural income gap into a single analytical framework,
24 this study identifies the mechanisms through which employment and human capital
25 accumulation mediate the convergent effects of digital inclusive finance. Contrary to
26 some studies (Lai et al., 2020; Sodokin et al., 2023), this paper demonstrates that the
27 effects of digital inclusive finance are more pronounced in more developed regions,
28 depending on the presence of a digital threshold. Therefore, this study introduces a digital
29 threshold variable to further examine its impact on the urban-rural income gap. The
30 findings suggest that the effects of digital inclusive finance are further amplified once
31 this digital threshold is surpassed.

46
47
48
49
50
51
52
53 This study recognizes certain limitations. First, this paper utilizes the Digital
54 Inclusive Finance Index developed by Peking University to assess the growth of digital
55 inclusive finance. However, this index primarily depends on data from Alipay,
56
57
58
59
60

1
2
3
4
5 a single digital financial platform among many others. Alipay's data mainly reflects
6 demand-side trends across different regions and does not include information on large
7 corporations or significant enterprises. As a result, the index may not be fully
8 compatible with data from large companies and might not provide a complete picture
9 of the overall development of digital inclusive finance. Second, limitations in
10 macroeconomic data mean that current statistics do not adequately represent the
11 development of rural areas. This shortcoming hampers evaluating how digital inclusive
12 finance impacts income disparities in rural regions. Finally, the heterogeneity analysis
13 in this paper examines regional variations in the influence of digital inclusive finance
14 on the income gap between urban and rural residents. However, it does not consider
15 whether these effects exhibit threshold behavior across different regions. Future
16 research will explore this dimension.

26 6. Conclusions and recommendations

28 6.1 Main conclusions

29 The key findings are: First, digital inclusive finance reduces the urban-rural
30 income gap. This conclusion is robust after various robustness checks. Second,
31 mechanism analysis indicates that digital inclusive finance reduces the income gap by
32 boosting employment, increasing non-agricultural jobs, and fostering rural human
33 capital development. Third, the analysis of regional differences reveals a digital
34 divide in the effectiveness of digital inclusive finance. Introducing a digital threshold
35 variable, based on mobile phone ownership rates, was introduced to address the digital
36 divide. Results indicate that when digital inclusive finance exceeds this threshold,
37 its effectiveness in reducing the income gap is significantly enhanced.

46 6.2 Recommendations

47 The advancement of digital inclusive finance demands continuous and proactive
48 efforts. The swift progression of digital technology has established the digital economy
49 as an unstoppable force, with future innovations poised to bring substantial
50 breakthroughs. Identifying convergence points between digital technology and
51 inclusive finance, while accounting for their evolving nature, is essential. This strategy
52 will deepen the integration of digital technology with inclusive finance, thereby
53
54
55
56
57
58
59
60

fulfilling the potential of digital inclusive finance by improving its accessibility and affordability.

Financial institutions should be incentivized to innovate and broaden the variety of financial products available in rural regions. Thorough research to understand the unique financial needs of rural residents is essential. Providing accessible and varied financial products that meet these specific needs is vital. In underdeveloped areas, efforts like reducing loan interest rates, simplifying approval processes, and innovating financial services to enhance credit efficiency and lower access barriers.

Appendix :

Table A. 1 Definitions of Variables

Nature of the variable	Level 1 indicators	Secondary indicators	Quantitative statistical indicators
Dependent variable	Income gap between urban and rural residents (Theil)		Obtained through data collection calculations
Independent variable	Level of development of digital financial inclusion (Dfi)	Depth of digital financial inclusion (Dd) Degree of digitization	Reference to the Digital Inclusive Finance Index System compiled by the Digital Finance Research Center of Peking University
Control variable	Gross regional product per capita (Gdp)		GDP at the end of the year / resident population at the end of the year for each province and municipality
	Urbanization rate (Urban)		Proportion of regional urban population / regional population
	Fiscal expenditure (Fe)		Fiscal expenditure as a share of regional GDP
	Regional level of education (Edu)		Average number of years of schooling of the population aged 6 years and over Average number of years of schooling at age 6 and above = [number of people not attending school * 0 + number of elementary school * 6 + number of junior high schools * 9 + number of senior high schools * 12 + (colleges + universities + postgraduate students) * 16] / number of

people aged 6 and above

	Degree of openness to the outside world (Open)	Total import and export of foreign-invested enterprises as a share of regional GDP
Mechanism	Total employment	
variables	(Employ)	Total urban employment
	Structure of non-farm payrolls (Nonemp)	Non-farm payroll/total regional employment
	Rural human capital (Humanexp)	Expenditures on education and health
Threshold variables	Digital threshold (Digthr)	Number of mobile cellular subscribers/regional population
Instrumental variable	Geographic distance (Dis)	Spherical distance from home city to Hangzhou
